Software Engineer II (REMOTE) | TENEX.AI

Cover letter

Hello TENEX.AI team,

I've thought of myself as a technomancer since I was a kid. Technology felt like magic, and I wanted to learn enough to make it work for people. That's what drew me to this job: your engineers are building software for defenders who need to understand a signal and make a good decision while the clock is running.

At Front Range Internet, I ran the NOC and handled the escalations it couldn't resolve. I also led SOC 1 and SOC 2 audits and migrated workloads into Docker and Kubernetes. When you're the person getting the escalation, it matters whether a tool tells you what happened, what changed, and where to look next. That experience still shapes the way I build interfaces and APIs.

For ProofMark, I worked on document signing in React and Next.js, with recipient routing, verification and an audit trail behind it. At Technomancy IT, I built a TypeScript and PostgreSQL platform that brings support, scheduling and billing together while keeping client access separate. I've also built AI-assisted client workflows where I could keep the underlying tools and data boundaries explicit.

I'd bring that mix of full-stack development and production ownership to the team. I'd be glad to talk about how your analysts use the platform today and where better software could take friction out of their day.
